

Clinical Laboratory Report

Patient: Nick

DOB: 1966 (Age 60)

Report Date: April 19, 2026

Active DX: ASCVD, HTN, Prediabetes

Latest Lipid Panel Results (March 2026)

DATE	MARKER	RESULT	UNITS	REF. RANGE	CLINICAL NOTES
3/15/2026	Total Cholesterol	142	mg/dL	<200	Fasting: Yes
3/15/2026	LDL Cholesterol (calculated)	68	mg/dL	<70	Fasting: Yes; at target
3/15/2026	HDL Cholesterol	58	mg/dL	>40	Fasting: Yes; excellent; exercise effect
3/15/2026	Triglycerides	82	mg/dL	<150	Fasting: Yes; excellent
3/15/2026	Non-HDL Cholesterol	84	mg/dL	<100	Fasting: Yes; at target
3/15/2026	ApoB	68	mg/dL	<80	Fasting: Yes; at target
3/15/2026	Lipoprotein(a)	90	nmol/L	<75	Fasting: Yes; elevated; genetic; not responsive to statin therapy; discuss with cardiologist

Clinical Interpretation & Longitudinal Context

ApoB and LDL-C Targets: Nick's ApoB (68 mg/dL) and LDL-C (68 mg/dL) are successfully at the aggressive secondary prevention targets (<80 mg/dL and <70 mg/dL respectively) for a high-risk ASCVD patient with a prior NSTEMI.

Lipoprotein(a) Alert: Lp(a) is elevated at 90 nmol/L. This is a strong, independent genetic risk factor that is generally unresponsive to statin therapy. This requires continued aggressive control of all other modifiable risk factors and ApoB-containing lipoproteins.

Metabolic Markers: Triglycerides are excellent at 82 mg/dL. HDL is 58 mg/dL, showing a positive protective effect likely linked to high activity level (5x/wk gym, hiking, cycling).
